Customer summary

foto-1.jpg · Evidence ID: E0003 · Case: SAMPLE-1

Needs attention

The file was hashed and checked. Some points need attention.

What we did

Each file was opened read-only and hashed in a single pass with the selected algorithms, and its real type was identified from its signature. JPEG, HEIC, PNG and WebP images were then re-read in an isolated process and the bytes read were hashed again and compared with the first pass. The image analysis read the file structure and metadata, compared the JPEG quantization tables with the IJG standard and the fingerprint databases, looked for double JPEG compression, wrote the selected visual maps (error level, noise, JPEG ghosts), searched for copied-and-moved regions, compared the embedded thumbnail with the main image and, when reference images were given, compared the image with them. HEIC pixels are not decoded (structure and metadata only). Every action and every file written was recorded in a hash-chained audit log.

What the checks looked at

Format	JPEG
Dimensions (pixels)	96 × 64

What we found

- Little or no camera metadata. The JPEG file carries no camera metadata (no make, model or capture date).
- Standard (IJG) compression tables. The quantization tables are the IJG standard tables at quality 85.
- Compression tables not in the database. No entry of the fingerprint databases matches these tables (SHA-256 43920728cfe021cebc3e0bf197ec4338c16eec09bf89e4b7a5cac6f67651ebfa).

Digital fingerprint

This fingerprint identifies the exact content of the file. Any change, even of one character, would produce a different value.

sha256	`2c131e2942ef56ad7a4a6ecdce4740846e5c76f9d04fa46ac80b3753dad6b0cb`
